                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               INHIBIT THEM. IT IS HIGHLY ACTIVE AGAINST THE NEUROMUSCULAR RECEPTOR IN PROG BUT NOT IN MICE. IN CONTRAST, IT INDUCES SEIZURES WHEN INJECTED CENTRALLY IN MICE AND RATS. IT TARGET NEURONAL NACHRS IN MAMMALS. BLOCKS HOMOMERIC ALPHA-7 NICOTINIC RECEPTORS WITH THE HIGHEST APPARENT AFFINITY AND HOMOMERIC ALPHA-9 RECEPTORS WITH 8-FOLD LOWER AFFINITY. HAS NO EFFECT ON RECEPTORS COMPOSED OF ALPHA-2, BETA-2, ALPHA-3/BETA-2, ALPHA-4/BETA-2, ALPHA-2/BETA-4, OR ALPHA-3/BETA-4, OR ALPHA-4/BETA-4 SUBUNIT COMBINATIONS.

"Alpha-conotoxin AuIB selectively blocks alpha3 beta4 nicotinic acetylcholine receptors and nicotine-evoked norepinephrine release.";

J. Neurosci. 18:8571-8579(1998).

-i-FUNCTION: ALPHA-CONOTOXINS ACT ON POSTSYNAPTIC MEMBRANES, THEY BIND TO THE NICOTINIC ACETYLCHOLINE RECEPTORS (NACHR) AND THUS INHIBIT THEM. THIS PEPTIDE BLOCKS MAMMALIAN NICOTINIC ACETYLCHOLINE RECEPTORS COMPOSED OF ALPHA-J/BETA-4 SUBUNITS.

-i- MASS SPECTROMETRY: MM-1572.5; METHOD=ELECTROSPRAY.

POSTSYNAPTIC neurotoxin; Acetylcholine receptor inhibitor; Amidation;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to peptidomimetics containing 6-peptidylamino-1-naphthalenesulphonamide moleties. They are peptidomimetics of natural substrates for activated protein C (APC), whose substrates are promoters of the blood coagulation process. The present sequence represents a specifically claimed peptidomimetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptidyl-amino-1-naphthalene-sulphonamide compounds - are peptidomimetics of natural substrates for activated protein C, useful as promoters of the blood coagulation process
                                                                                                                                                                                                                           Key

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 disease, thyroid adenoma, hypertension, cardiomyopathy, schizophrenia, major depression, Kaposi's sarcoma and many others tabulated). It is based on identification of agents that reduce receptor activation, rather than compounds that antagonise the normal ligand. Once identified, (inverse) agonists can be used to study OR function. The method does not require knowledge of the endogenous receptor ligand or receptor function, and identifies directly compounds that inhibit the activated receptor, i.e. able to block both ligand-dependent and independent activation, rather than only the ligand-dependent process, as is the case with compounds identified by ligand-dependent assays. It should accelerate drug discovery at a wide range of OR and since activated receptors have a greater response to the agents, potential drugs are more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mutational cassette. The invention relates to a method for the identification of candidate compounds as agonists, including inverse or partial, of an orphan receptor (OR), which comprises: (i) applying test compound to constitutively active OR; and (ii) measuring its effect on OR. The method is particularly used to identify inverse agonists of G protein-coupled OR, i.e. potential therapeutic agents for treating conditions in which constitutively active OR are implicated (e.g. Graves, conditions in which constitutively active OR are implicated (e.g. Graves, conditions in which constitutively active OR are implicated (e.g. Graves, conditions in which constitutively active OR are implicated (e.g. Graves, conditions in which constitutively active OR are implicated (e.g. Graves, conditions in which constitutively active OR are implicated (e.g. Graves, conditions in which constitutively active OR are implicated (e.g. Graves, conditions in which constitutively active OR are implicated (e.g. Graves, conditions in which constitutively active OR are implicated (e.g. Graves, conditions in which constitutively active OR are implicated (e.g. Graves, conditions in which constitutively active OR are implicated (e.g. Graves, conditions in which constitutively active OR are implicated (e.g. Graves, conditions in which constitutively active OR are implicated (e.g. Graves, conditions in which constitutively active OR are implicated (e.g. Graves, conditions in which constitutively active OR are implicated (e.g. Graves, conditions in which constitutively active OR are implicated (e.g. Graves, conditions in which constitutively active OR are implicated (e.g. Graves, conditions in which constitutively active OR are implicated (e.g. Graves, conditions in which constitutively active OR are implicated (e.g. Graves, conditions in which constitutively active OR are implicated (e.g. Graves, conditions in which constitutively active OR are implicated (e.g. Graves, conditions in which conditions in which constitutively active OR are implicat

The method comprises determining the efficacy of the compound by contacting it with the ORR. A compound identified by the above method having inverse agenist activity to ORR is useful for the treatment of diseases characterised by constitutive activation of the receptor e.g. Graves' disease, male precoclous puberty, Jansen's disease, retinitis pigmentosa, hypoparathyroidism, neuropsychiatric diseases, schizophrenia, major depression, and cancerous growth in Kaposi's sarcoma. The method can identify (I) directly without prior knowledge or use of receptor ligands and is useful for accelerating drug discovery at a broad range of ORR. The present sequence represents a fibroblast growth factor 3 receptor invalidational cassette, which is used in the exemplification of
Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying compounds with inverse agonist activity to orphan receptor: useful for treating e.g. Graves' disease, and schizophrenia, involves contacting candidate compounds with constitutively activated receptors

The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.
                                                                                                                                                                                                                                                                                                                WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Probe; microarray;

                                                                                                                                   The present invention relates to novel single exon nucleic acid probes (see AAI00010-AAI10067). The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic aetiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                    04-FEB-2000;

The colon CC cancer antigens have cytostatic activity and can be used in gene CC therapy and vaccine production. N and P may be used in the prevention, CC diagnosis and treatment of diseases associated with inappropriate P CC expression. For example, N and P may be used to treat disorders CC associated with decreased expression by rectifying mutations or deletions CC in a patient's genome that affect the activity of P by expressing CC inactive proteins or to supplement the patients own production of P. CC Additionally, N may be used to produce the colon cancer-associated Ps, CC by inserting the nucleic acids into a host cell and culturing the cell CC by inserting the proteins. N and P can be used in the prevention, diagnosis CC and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 CC and AAB77789 represent sequences used in the exemplification of the

Unlike other methods of humanisation, which advocate the replacement of entire antibody framework regions with those of human antibodies, this method involves only the introduction of human residues into those positions not critical for antigen binding. This ensures that the binding properties of the modified antibody

                                                                                                                                                                                                                                                                                                                                                                                                                         a method has been developed of depleting CD5+ cells in an animal. The comprises administering a cytotoxic protein containing a modified immunoglobulin (Ig) variable domain, where the protein is an anti-CD5 Ig conclude or an immunoconjugate or fusion protein containing an anti-CD5 Ig conclude or an immunoconjugate or fusion protein containing an anti-CD5 Ig conclude or an immunoconjugate or fusion protein containing an anti-CD5 Ig molecule, and where the modified Ig variable domain comprises at CC least one of (a) a modified heavy chain variable region (see AAW58478 or CC CAAW58480), and (b) a modified heavy chain variable region (see AAW58479 CC or AAW58481), where AAW58478 and AAW58479 are humanised forms of the H65 Ight and heavy chain variable domains with low risk amino acid substitutions [i.e. low risk of reducing antigen-binding specificity.] CC and AAW58480 and AAW58481 are humanised forms of the H65 Ight and heavy chain variable domains with moderate risk amino acid substitutions and are present in humanised H65 antibody ha3 (ATCC HB 11206). The method is CC customatosus, rheumatoid arthritis, psoriasis or type I diabetes. The present sequence represents a consensus amino acid sequence for light chain subgroups of human antibody variable domains, from the present revertion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Best Local Similarity

The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' ends and can therefore be used to obtain full length cDNAs. S' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.

Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acids encoding 4277 human useful for preventing, diagnosing

The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the

                                                                                                    This sequence represents human plasma glutathione peroxidase (pGPxH). The invention relates to this novel human glutathion peroxidase, nucleic acid encoding it, and to recombinant procof human pGPxH. The invention also encompasses applications if
                                                                                                                                                                                                                                                         Yu L,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          peptides (e.g. see AAR72679) were derived from hydrophobicity/flexibility profiles of the published sequence. Peptides containing this sequence can be conjugated to carrier proteins and used to produce antibodies. The antibodies can be used to detect plasma glutathione peroxidase in immunoassays e.g. for detection of selenium deficiency or in diagnosis of certain kidney or liver diseases e.g. graft

                                                                                                   The present sequence represents the representative construct fusion T6 CC which is involved in the rapumycin-dependent activation of signal CC transduction. This is involved in the construction of transcription CC factor fusion proteins, which in turn are involved in the production of canimal cells containing at least two recombinant DNAs. One DNA should cencode a chimeric protein which is capable of binding to rapamycin, or a capamycin analogue, and comprises at least one rapamycin binding domain CC (RBD) and at least one protein domain heterologous to it; the second crocombinant DNA should encode a second chimeric protein which is capable of forming a complex with rapamycin, or a rapamycin analogue, and the CC first chimeric protein and comprises at least one FKBP:rapamycin binding CC (FRB) domain and at least one domain heterologous to it. Contacting these genetically engineered cells with rapamycin or analogues, and the complex (between the fusion proteins, and the cc used for regulating biological events such as gene transcription, capamycin), and intracellular signal transduction pathway leading to ce.g. gene expression or appopical events such as gene transcription, and complex (between the fusion proteins, and the continuation of intracellular signal transduction pathway leading to ce.g. gene or inhibition of function of a gene whose cut, blockade of a gene or inhibition of function of a gene product. They are used cc recombinant proteins and viruses.

                                                                                                                                                                                                                                            The present sequence represents a consensus B7RP1 (B7 related protein-1) polypeptide. The specification also describes a CRP1 (CD28 related protein-1) polypeptide. The polypeptides are involved in T-lymphocyte activation, and represent a receptor-ligand pair. CRP1 and B7RP1 are predicted to be a type I transmembrane protein. The nucleic acids are useful for regulating T cell activation or proliferation in an animal. The polypeptides are useful for treating, preventing ameliorating or diagnosing a T-cell mediated disorder in an animal. They can also be used to identify test molecules that bind to the polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CRP1; CD28 related protein-1; B7RP1; B7 related protein-1; T-lymphocyte activation; type I transmembrane protein; T cell activation; T cell proliferation; T-cell mediated disorder.

                                                                                                                                                                                                                                                                                        The present sequence represents a consensus B7RP1 (B7 related protein-1) polypeptide. The specification also describes a CRP1 (CD28 related protein-1) polypeptide. The polypeptides are involved in T-lymphocyte activation, and represent a receptor-ligand pair. CRP1 and B7RP1 are predicted to be a type I transmembrane protein. The nucleic acids are useful for regulating T cell activation or proliferation in an animal.
          Diphtheria toxin (delta-147-148; H21X) mutant.
                                                                            AAR44893 standard; Protein; 533
                                                                                                                                                                                                                                                          The polypeptides are useful for treating, preventing ameliorating or diagnosing a T-cell mediated disorder in an animal. They can also be used to identify test molecules that bind to the polypeptides.

                                                                                                                                                                                                                                                              Oligonucleotide-directed mutagenesis of the wild-type diphtheria gene results in deletion of the codons for val-47 and active site residue Glu-148. The resulting mutein is not toxic, making it useful in diphtheria vaccines. The risk of reversion to toxicity is much lower for the 147-148 double mutant than for the prior art 148 single mutant, while its immunogenicity is not impaired. The 147-148 mutein opt. has other amino acid residues substd. or deleted, e.g. wild-type His(21) in fragment A. The specification includes the wild-type DT amino acid sequence (see AAR44888) but does not include any mutant sequences; the wild-type sequence was modified according to the description in the claims to give AAR44893.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Key

These sequences have greater product selectivity and/or reduced product inhibition (better yields) than wild-type CGTase. These mutant sequences are used to manufacture the 6 main CD types (comprising 6-11 glucose units), or linear 2-12 glucose oligosaccharides, optionally in situ, e.g. during production of baked goods, to stabilise chemicals during their manufacture and in detergents. CD are known for their usefulness in foods, e.g. as a bread-improving agent, to encapsulate/stabilise/solubilise vitamins, dyes, pharmaceuticals, pesticides or fungicides, to bind/remove lipophilic compounds such as cholesterol (e.g. in egg yolk or butter), in plastic laminates, films etc. and to make biodegradable plastics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sequence). CGTase catalyses the conversion of starch and similar via an substrates into cyclomaltodextrins (also known as cyclodextrins) via an intramolecular transglycosylation reaction. Cyclodextrins (CD) are cyclic glucose oligomers with a hydrophobic internal cavity that form inclusion complexes with many small hydrophobic molecules. These CGTase mutants have a modified substrate binding and/or product selectivity, compared
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAW17580-W17591, and AAW17606-W17652 represent mutant versions of t cyclomaltodextrin glucanotransferase (CGTase) of Thermoanaerobacter thermosulphurigenes sp. ATCC 53627. (see AAW06772 for wild type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New variants of cyclo:malto:dextrin glucanotransferase (CGTase) - have altered substrate binding, useful for prodn. of cyclodextrin(s) or linear oligosaccharide(s), opt. formed in situ in e.g. baked

AAW17580-W17591, and AAW17606-W17652 represent mutant versions of the cyclomaltodextrin glucanotransferase (CGTase) of Thermonnaerobacter thermosulphurigenes sp. ATCC 53627. (see AAW06772 for wild type sequence). CGTase catalyses the conversion of starch and similar substrates into cyclomaltodextrins (also known as cyclodextrins) via an intramolecular transglycosylation reaction. Cyclodextrins (CD) are cyclic glucose oligomers with a hydrophobic internal cavity that form inclusion

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          6 main CD types (comprising 6-11 glucose units), or linear 2-12 glucose oligosaccharides, optionally in situ, e.g. during production of baked goods, to stabilise chemicals during their manufacture and in detergents. CD are known for their usefulness in foods, e.g. as a bread-improving agent, to encapsulate/stabilise/solubilise vitamins, dyes, pharmaceuticals, pesticides or fungicides, to bind/remove lipophilic compounds such as cholesterol (e.g. in egg yolk or butter), j plastic laminates, films etc. and to make biodegradable plastics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       have a modified substrate binding and/or product selectivity, compared to this sequence. The mutants are created using primer mutagenesis to modify the gene encoding this sequence. These sequences have greater product selectivity and/or reduced product inhibition (better yields) than wild-type CGTase. These mutant sequences are used to manufacture

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Arg,
               modify the gene encoding this sequence. Incomposition (better yields) product selectivity and/or reduced product inhibition (better yields) product selectivity and/or reduced product inhibition (better yields) product selectivity and/or reduced product inhibition (better yields) than wild-type CGTase. These mutant sequences are used to manufacture the 6 main CD types (comprising 6-11 glucose units), or linear 2-12 glucose oligosaccharides, optionally in situ, e.g. during production of baked goods, to stabilise chemicals during their manufacture and in detergents. CD are known for their usefulness in foods, e.g. as a bread-improving agent, to encapsulate/stabilise/solubilise vitamins, dyes, pharmaceuticals, pesticides or fungicides, to bind/remove lipophilic compounds such as cholesterol (e.g. in egg yolk or butter), in plastic laminates, films etc. and to make biodegradable plastics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           16-NOV-1995;

                                                                                                                                                            complexes with many small hydrophobic molecules. These CGTase mutants have a modified substrate binding and/or product selectivity, compared to this sequence. The mutants are created using primer mutagenesis to modify the gene encoding this sequence. These sequences have greater product selectivity and/or reduced product inhibition (better yields)
                                                                                                                                                                                                                             substrates into cyclomaltodextrins (also known as cyclodextrins) via an intramolecular transglycosylation reaction. Cyclodextrins (CD) are cycliglucose oligomers with a hydrophobic internal cavity that form inclusion
                                                                                                                                                                                                                                                                               AAW17580-W17591, and AAW17606-W17652 represent mutant versions of the cyclomaltodextrin glucanotransferase (CGTase) of Thermoanaerobacter thermosulphurigenes sp. ATCC 53627. (see AAW06772 for wild type
                                                                                                                                                                                                                                                                                                                                                                        New variants of cyclo:malto:dextrin glucanotransferase (CGTase) have altered substrate binding, useful for prodn. of cyclodextrin(s) or linear oligosaccharide(s), opt. formed in situ in e.g. baked
